

Learning Management System

Ecosystem Over Standalone Solutions

Client Profile & Project Objectives

Client Name: Confidential *(To be shared post second level meeting with stakeholders)*
Domain/Industry: Automobile Spare Parts Industry *(Manufacturing and distributorship across India)*
Team Size: 500-1000 Users *(Tentative numbers, actuals yet to be shared keeping distributor and vendor count into consideration)*

Background Context

The automobile spare parts industry operates in a highly competitive and distributed ecosystem involving manufacturing units, regional sales teams, distributors, channel partners, vendors, and customer-facing support functions spread across India.

As organisations continue to scale operations, there is an increasing need to move beyond traditional Learning Management Systems (LMS) and build integrated learning ecosystems that not only manage learning records but also drive capability development, performance improvement, operational governance, and measurable business outcomes.

The client organisation intends to deploy a customised LMS ecosystem for an initial employee base of 500–1000 users, with future scalability planned for distributors, vendors, and external stakeholders across the business network.

Project Goal

The organisation seeks to move beyond a traditional LMS framework and build a scalable, intelligence-driven learning ecosystem capable of transforming capability development into a measurable business growth driver

Client ROI Targeted Goal: 10% to 15% increment in sales revenue

Targeted Success Metrics:

- Successful deployment across organisation
- 100% migration of users on the platform
- Successful integration of standalone features in LMS
- Customised reporting dashboard operational including email workflows
- Fully operational intelligent TNA engine
- Seamless interactive content deployment
- Multilingual capability across content & AI Voice BOT

LMS Ecosystem Objective

The proposed LMS ecosystem should function as a strategic business enablement platform rather than a standalone training repository.

The ecosystem must:

- Enhance practical learning experience
- Improve sales capability and product knowledge
- Enable skill-based growth journeys
- Automate coaching and feedback
- Generate actionable Training Needs Analysis (TNA)
- Improve training governance
- Deliver business intelligence through customised reporting
- Drive measurable business ROI

Standard LMS Limitations VS LMS Ecosystem

Traditional LMS platforms currently available in the market primarily function as training record management systems and present several limitations. Proposed LMS ecosystem solution would transform LMS into a fully integrated capability development engine

Limitations of Standard LMS

Limited Functional Scope

- Training completion tracking
- Attendance management
- Assessment scores

Basic Dashboards

- Limited business relevance
- Lacks role-based intelligence
- No visibility of learner engagement

Weak Practical Training

- Lacks experiential learning
- Minimal coaching automations
- Lacks behavioural coaching
- Lacks real-life customer simulation

Lacks Actionable Insights

- Raw tabular sheets for reports
- No predictive & intelligent reports
- MIS dependant model for reports

TNA Generation Inability

- Unable to identify skill gaps
- Unable to recommend interventions
- Unable to map performance trends

Commercial Visibility

- No visibility into usage
- No visibility into commercials
- No deep analytics around ROI against licence/commercial investment

LMS Ecosystem Vision

Standard LMS Features

- Skill based growth map
- Live training classroom
- Structured assessments
- Gamification & Reward hub

Deep Investment Analytics

- ROI against commercial investment
- LMS usage & content consumption
- Insights into recurring commercials
- Dormant licence report

Interactive Training Content

- XAPI Integration
- Learner's learning behaviour insights
- Change management insights
- Robust assessment governance model

Dynamic Dashboard

- Customised widgets as per role
- Visual analytics instead of tabular data
- Actionable insights
- Automated email workflows

Enhanced Practical Training

- Voice BOT Integration
- 400% increase in role-play practice
- Automated coaching & feedback
- Actionable insights from TNA engine

TNA Engine

- Competency based TNA via AI BOT data
- Actionable insights based on TNA
- SMART goals created basis TNA

Learning Management System

The client aims to develop a centralised LMS platform to enhance employee capability development, automate training operations, improve compliance tracking, and enable scalable digital learning across business functions

Vendors are expected to provide visibility into

User Management

- Role Based Access (SSO)
- Department waise learner mapping
- Manager Hierarchy Allocation
- User roles (Yet to be defined by the client)

Course Management

- Skill based learning journey
- Assign mandatory trainings
- Multiformat Uploads (Refer FAQs)
- Instructor-led session scheduling
- Course change management
- Course version control

Course Structure

- Learning Journey
- Skill
- Training Courses
- Training Assessments

Assessment Model

- Quiz creation
- Multiple question types (Refer FAQs)
- Randomised question banks
- Times assessments
- Passing thresholds
- Auto certification
- Certification expiry tracking

Learning Experience

- Personalised dashboards
- Resume learning
- Gamification and leadership boards
- Discussion forums
- Recommendation engine

Reporting Analytics

- Course completion & status
- Assessment performance
- Training hours
- Learner engagement
- TNA engine reports
- Function specific reports (Refer FAQs)
- Real time analysis
- Excel/PDF exports
- Scheduled reports

Notification Workflow

- Enrolment confirmation
- Course reminder (Due date alerts)
- Certification expiry alerts
- Manager escalation notification
- Email workflows for reports
- Notification type (Emails, SMS & Push Notification)

Non-Functional

- Performance
 - Supports concurrent users
 - Loading Time <3 seconds
- Security
 - SSL encryption
 - Role-based access control
 - Data backup and recovery
- Accessibility
 - Multi-browser support
 - Mobile responsive (Phase 2)
- Scalability
 - API first design
 - Cloud hosted architecture

Compliance Governance

- Audit trails
- ISO compliance Support
- Regulatory certifications
- Content approval workflow
- Role-based permissions
- Version management

Integration Capabilities

- XAPI Integration
- AI Voice BOT integration
- API readiness
- Reporting Engine Integration (TNA)

AI Voice BOT Integration

AI Voice BOT integration is essential to this project. Voice BOT would have two primary features to execute. It would act as an avatar and interact with the learners basis the scenarios, customer profiles and difficulty level. It would also act as an auditor to audit the interaction and share constructive feedback with the learners along with SMART goals. Data from the interaction would be used by the engine to provide TNA for further development

Usage - Mock practice sessions and skill based certifications

AI Voice BOT (Avatar)	AI Voice BOT (Auditor)	Training Need Analysis	LMS Integration Approach
• Ability to simulate real life scenarios • Ability to simulate different customer profiles • Analytical customer • Assertive customer • No interested in sales • Customer pressed on time • Irrate customer • Buying on someone’s behalf • Ability to set difficulty levels based on users learning journey • Ability to intuitively react basis user’s response Next Steps: Future developments based on client approval and needs • Multilingual support • Ability to talk in different accents in order to simulate real life scenarios	• Ability to evaluate the interaction based on the customer scenario • Ability to evaluate the interaction based on pre-defined competencies • Ability to evaluate learner behaviour and recommend areas of improvement • Ability to generate a score based on pre-defined rating rubric and record feedback • Ability to predict NPS based on customer experience • Ability to provide constructive feedback based on the audit • Audit parameters • Defined competencies (Sales - 8 in total) • User behaviour • Tone & clarity • ROS • Trigger points • Speaking over the customer	Individual Based TNA • Ability to generate TNA based on pre-defined competencies • Ability to generate TNA based on user behaviour • Define SMART goals based on the interaction • Clear timelines • Defined success metrics • Recommended next steps Consolidated TNA • Skill gap identification • Behavioural trend analysis • Region wise capability analysis • Product knowledge gaps • Coaching opportunity identification	• The BOT would be launched from LMS capturing learners unique id • Unique id would be generated for each conversation • Interaction recordings to be stored on the cloud for 72 hours (May change basis requirement) • Raw data to be stored at LMS • Email workflows to publish • User Feedbacks • SMART Goals • TNA reports Integration Approach (Recommend based on cost) • Approach 1: Integrate Voice BOT in LMS • Approach 2: Use it as a standalone feature • Launch Voice BOT from LMS • Build a batch upload mechanism to transfer data and recordings to be stored at LMS

Note: AI assistant can be recommended to the client as an additional feature leveraging content from LMS for support

Interactive Training Content - XAPI Integration

We are looking at leveraging XAPI platform for creation of interactive training content. We chose this as it may also help us in providing more data driven insights, determining change management opportunities and help strengthen the training governance. If there are better models than XAPI which capture more details around learner engagement, please feel free to recommend

Functional Capability

- Ability to create learning journey
 - Learners would follow a set learning path
 - They would not be allowed to jump to content as per their will
 - Next training content will only open for the learner when he successfully clears the content currently assigned to him
- Ability to create and embed simulations
- Ability to create learning games and activities
- Ability to create dynamic assessments
- Ability to record learner responses for activities embedded in training material
- Ability to record learner’s attempts for learning activities and assessments

Deep Learning Analytics

- Provide insights into learner engagement
- Insights to focus on below mentioned parameters
 - Time spent on content
 - Section wise engagement
 - Revisited sections
 - Drop-off points
 - Activity participation trends
 - Assessment behaviour trends
 - Option level insights for learner responses

This data is instrumental for TNA and change management opportunities

Training Governance

- Supports advanced governance mechanisms
- Prevents learners from switching screens during assessments
- AI assistant is disabled during assessment
- Prevents learner from using emails or IMs during assessment
- Raises alert if two faced are observed during assessments
- Learner identification (If possible) based on user profile
- Audit logs for learner activities
- Governance tracking dashboards
- Compliance monitoring alerts
- Email workflows for reporting violations

Learner Feedback & CM

- Structured learner feedback mechanism
- LMS should be able to
 - Present module level feedback
 - Provide feedback analytics along with actionable insights
 - Automated escalations workflows
 - Change management recommendations
- Trending courses based on learner rating
- Courses which need immediate attention based on learner rating
- Feedback into activities based on learner engagement and rating

* CM - Change Management

Note: AI assistant can be recommended to the client as an additional feature leveraging content from LMS for support

BRD FAQs

Q1. Who is this requirement for?

Mohit J: This requirement is for a client dealing in automobile spare parts industry

Q2. What is the context behind the requirement?

Mohit J: This requirement is a part of a Sales Capability Program aimed to develop sales capabilities. Program will be rolled out PAN India which further emphasises the need for a mechanism to not only track and monitor training progress but to provide visibility and actionable insights to stakeholders involved in the project

Q3. What is the anticipated timeline to go live?

Mohit J: Targeting ~3 to 4 months keeping into consideration voice bot learning and all feature deployment, testing & final go live

Q4: How many total users will be access the platform?

Mohit J: The client has given a tentative number of users from 500-1000. This number may increase keeping into consideration that they would extend this to their distributors and vendors

- LMS Licences: 500-1000
- XAPI Content Creation Tool Licences: 2-5 licences
- AI BOT Licences: 20 licences (Need to understand how this works from the vendors. If the BOT has the capability to interact with multiple users at the same time and the billing is not based on licences but tokens/minutes then we will update accordingly)

Q5. What does organisational hierarchy look like?

Mohit J: Currently we don't have visibility into this subject. More clarity to come as we have further discussions with the client

Q6. How will learners access the platform?

Mohit J: As of now we are looking at cloud based solutions for the learners. We will get clarity from the client on mobile app requirement for this project. However as of now we are presuming that they would access the content using PC/Laptop

Q7. What languages must the platform support for the UI and content?

Mohit J: We are targeting multilingual approach for the training content and voice bot however, the UI will only support English as a language

Q8. What type of courses will be created and hosted on the platform?

Mohit J: We will leverage the platform to host various types of courses such as videos, PPTs, PDFs, learning games etc. The focus will be more inclined towards interactive content over traditional training content. XAPI is the preferred medium for interactive content creation

Q9. Will the trainers directly create courses on LMS?

Mohit J: Yes, that's the goal however it would depend on training program deployment timelines and client preferences

Q10. How will the learner journey be structured?

Mohit J: For sales capability, we will have structured modules and learners would have to complete the modules in a sequence. For growth maps, detailed discussion will happen with the client to identify skills required for each role, courses will be created and mapped accordingly. There will be few monthly mandatory courses that each learner would have to completed and the learner would also be given an option to assign relevant courses to himself based on journey as well as interest. These courses will be approved by their manager and only then these courses will be made available to the learners

BRD FAQs

Q11. What are the expectations around live training (virtual classrooms)?

Mohit J: Live training is a requirement for the project with the ability to record training attendance, training session video/audio, ability to store this video on the server, classrooms to be built with basic facilitation tools such as break out rooms, polls etc. We will reach out to the client to understand if they want to integrate teams or zoom on the platform

Q12: What is your current understanding of LMS & training programs used by the client to train their manpower?

Mohit J: The client gave us the project to look at it from fresh eyes. They have not shared insights into the current learning & development program or tools being used. They wanted a fresh approach and during the discussion they raised a request for LMS

Q13. What would the assessment and certification model look like?

Mohit J: We will follow two approaches for the certification. For all courses we will upload conceptual questions on LMS and passing threshold would be determined post final discussion with the client. The questions should be able to support single choice (radio button), multiple choice (Square button), True/False (radio button), fill in the blanks (radio buttons), arrange in the right sequence (Mouse drag & drop) and match the following (Mouse drag and drop). For competency based assessment we would leverage the AI BOT feature in the form on an audit being conducted for the learner. BOT will audit the interaction based on the rating rubric uploaded for core competencies and learner behaviour. Passing thresholds would be determined post discussion with the client. An employee would be given two attempts to clear the assessment. Re-assessment can only be scheduled post 12 hours of the first attempt. We will also give third attempt option but that option would be subject for approval from the training manager and operations lead

Q14. How do you plan to leverage LMS for Change Management?

Mohit J: We are looking at feedback forms specific to the training content for each module. The intent is for the learners and leaders to post feedback directly on the tool. The feedback would flow back to the training team in a raw tabular format for change management. At the time of course creation we would indicate users who can schedule these courses as well as users who have the authorisation to edit. Once a course has been edited a new version of the course would be made available. Older version would remain on the tool for 3 months but would be greyed out for the learners. A log of change management capturing the changes would also get published to defined stakeholders

Q15. What kind of reporting insights are you looking at driving from LMS?

Mohit J: Please find below the list of reports that we plan to roll out along with LMS. Emails workflows will be decided post discussion with the client

- Training completion reports
- Assessment reports
- LMS Usage (How many are actively using, how many redundant accounts, active and inactive users, reports indicating users not using LMS from more than 30 days). The report would be for all programs/divisions etc
- TNA analytics
- Training content performance logs (Sections where users are spending time, sections being skipped by learners, average time being spent on the content)
- Change management data and version control logs
- Mandatory training compliance
- Role-play bot utilisation
- Monthly invoice
- Weekly predictive invoicing
- Training governance logs such as users skipping slides, trying to switch windows, using internal messaging tool or email while taking assessments etc. If there is a way to authenticate users with Face ID, we can look at that from a future development perspective

Vendor Expectations

Vendors are encouraged to propose innovative, scalable, AI-enabled solutions aligned with the long-term vision of creating a connected learning and performance ecosystem for the automobile spare parts industry.

Vendors are expected to provide visibility into

Technical Architecture

- Recommended architecture
- Cloud/Onsite recommendations
- Scalability Model

Development Effort

- Customisation effort estimates
- Integration dependencies
- Resource requirements

Integration Capabilities

- XAPI Integration
- AI Voice BOT integration
- API readiness
- Reporting Engine Integration (TNA)

Deployment Timelines

- Phase wise rollout plan
- Pilot timelines
- Full scale deployment timeline

Commercial Structure

- Licensing model
- Recurring commercials
- Support commercials
- Scalability commercials

Support & Governance

- Post-deployment support
- SLA framework
- Enhancement support
- Governance model
